(Version 1.6, September 2009)
1* Introduction. The DVIcopy utility program copies (selected pages of) binary device-independent ("DVI") files that are produced by document compilers such as \TeX, and replaces all references to characters from virtual fonts by the typesetting instructions specified for them in binary virtual-font ("VF") files. This program has two chief purposes: (1) It can be used as preprocessor for existing DVI-related software in cases where this software is unable to handle virtual fonts or (given suitable VF files) where this software cannot handle fonts with more than 128 characters; and (2) it serves as an example of a program that reads DVI and VF files correctly, for system programmers who are developing DVI-related software.

Goal number (1) is important since quite a few existing programs have to be adapted to the extended capabilities of Version 3 of \TeX which will require some time. Moreover some existing programs are 'as is' and the source code is, unfortunately, not available. Goal number (2) needs perhaps a bit more explanation. Programs for typesetting need to be especially careful about how they do arithmetic; if rounding errors accumulate, margins won't be straight, vertical rules won't line up, and so on (see the documentation of \texttt{DVImath} for more details). This program is written as if it were a DVI-driver for a hypothetical typesetting device \texttt{out file}, the output file receiving the copy of the input \texttt{dvi file}. In addition all code related to \texttt{out file} is concentrated in two chapters at the end of this program and quite independent of the rest of the code concerned with the decoding of DVI and VF files and with font substitutions. Thus it should be relatively easy to replace the device dependent code of this program by the corresponding code required for a real typesetting device. Having this in mind \texttt{DVImath}’s pixel rounding algorithms are included as conditional code not used by DVIcopy.

The \texttt{banner} and \texttt{preamble comment} strings defined here should be changed whenever DVIcopy gets modified.

\begin{verbatim}
define my name ≡ 'dvi copy'
define banner ≡ 'This is DVIcopy, Version 1.6'  { printed when the program starts }
define title ≡ 'DVIcopy'  { the name of this program, used in some messages }
define copyright ≡ 'Copyright(C)1990,2009,Peter Breitenlohner'
define preamble comment ≡ 'DVIcopy 1.6 output from'
define comm length = 24  { length of preamble comment }
define from length = 6  { length of its 'from' part }
\end{verbatim}

2* This program is written in standard Pascal, except where it is necessary to use extensions; for example, DVIcopy must read files whose names are dynamically specified, and that would be impossible in pure Pascal. All places where nonstandard constructions are used have been listed in the index under “system dependencies.”

One of the extensions to standard Pascal that we shall deal with is the ability to move to a random place in a binary file; another is to determine the length of a binary file. Such extensions are not necessary for reading DVI files; since DVIcopy is (a model for) a production program it should, however, be made as efficient as possible for a particular system. If DVIcopy is being used with Pascals for which random file positioning is not efficiently available, the following definition should be changed from \texttt{true} to \texttt{false}; in such cases, DVIcopy will not include the optional feature that reads the postamble first.

\begin{verbatim}
(global in the outer block 2*) ≡
random reading: boolean;  { should we skip around in the file? }
\end{verbatim}

See also sections 17, 21, 32, 37, 46, 49, 62*, 65, 71, 77, 80, 81, 84, 90, 96, 100, 108*, 117, 120, 122, 124, 125, 128, 134, 142, 146, 157, 158, 173, 177, 183, 185, 193, 199, 220, 231, 244, 255, 259, and 301*.

This code is used in section 3*.
The program begins with a fairly normal header, made up of pieces that will mostly be filled in later. The DVI input comes from file `dvi_file`, the DVI output goes to file `out_file`, and messages go to Pascal’s standard output file. The TFM and VF files are defined later since their external names are determined dynamically.

If it is necessary to abort the job because of a fatal error, the program calls the `jump_out` procedure.

```
(Compiler directives 9)
program DVI_copy(dvi_file, out_file, output);
    const ⟨Constants in the outer block 5*⟩
        type ⟨Types in the outer block 7*⟩
        var ⟨Globals in the outer block 2*⟩
            ⟨Error handling procedures 23*⟩
            ⟨Define parse_arguments 293*⟩
    procedure initialize; { this procedure gets things started properly }
        var ⟨Local variables for initialization 16⟩
            begin kpse_set_program_name(argv[0], my_name); parse_arguments; print(banner);
                printLn(`Distributed under terms of GNU General Public License`); { Set initial values 18 }
            end;

5* The following parameters can be changed at compile time to extend or reduce DVIcopy’s capacity.

    define max_select = 10 { maximum number of page selection ranges }

    ⟨Constants in the outer block 5*⟩ ≡
        max_fonts = 400; { maximum number of distinct fonts }
        max_chars = 750000; { maximum number of different characters among all fonts }
        max_widths = 16000; { maximum number of different characters widths }
        max_packets = 65530; { maximum number of different characters packets; must be less than 65536 }
        max_bytes = 250000; { maximum number of bytes for characters packets }
        max_recursion = 10; { VF files shouldn’t recurse beyond this level }
        stack_size = 100; { DVI files shouldn’t push beyond this depth }
        terminal_line_length = 256;
            { maximum number of characters input in a single line of input from the terminal }
```

This code is used in section 3*.
7*  Introduction (continued).  On some systems it is necessary to use various integer subrange types in order to make **DVIcopy** efficient; this is true in particular for frequently used variables such as loop indices. Consider an integer variable $x$ with values in the range $0 \ldots 255$; on most small systems $x$ should be a one or two byte integer whereas on most large systems $x$ should be a four byte integer. Clearly the author of a program knows best which range of values is required for each variable; thus **DVIcopy** never uses Pascal’s integer type. All integer variables are declared as one of the integer subrange types defined below as **WEB** macros or Pascal types; these definitions can be used without system-dependent changes, provided the signed 32 bit integers are a subset of the standard type integer. All integer variables are declared as one of the integer subrange types defined below as  

\[
\text{define } \text{int}_32 \equiv \text{integer} \quad \{ \text{signed 32 bit integers} \}
\]

\[
\text{define } \text{int}_31 \equiv \text{int}_31_t
\]

\[
\text{define } \text{int}_24u \equiv \text{int}_24_u_t
\]

\[
\text{define } \text{int}_24 \equiv \text{int}_24_t
\]

\[
\text{define } \text{int}_23 \equiv \text{int}_23_t
\]

\[
\text{define } \text{int}_16u \equiv \text{int}_16_u_t
\]

\[
\text{define } \text{int}_16 \equiv \text{int}_16_t
\]

\[
\text{define } \text{int}_15 \equiv \text{int}_15_t
\]

\[
\text{define } \text{int}_8u \equiv \text{int}_8_u_t
\]

\[
\text{define } \text{int}_8 \equiv \text{int}_8_t
\]

\[
\text{define } \text{int}_7 \equiv \text{int}_7_t
\]

\[
\text{(Types in the outer block 7*) } \equiv
\]

\[
\text{int}_31 = 0 \ldots "7FFFFFFF; } \{ \text{unsigned 31 bit integer} \}
\]

\[
\text{int}_24u = 0 \ldots "7FFFF; } \{ \text{unsigned 24 bit integer} \}
\]

\[
\text{int}_24 = "800000 \ldots "7FFFF; } \{ \text{signed 24 bit integer} \}
\]

\[
\text{int}_23 = 0 \ldots "7FFFF; } \{ \text{unsigned 23 bit integer} \}
\]

\[
\text{int}_16u = 0 \ldots "FFFF; } \{ \text{unsigned 16 bit integer} \}
\]

\[
\text{int}_16 = "8000 \ldots "7FF; } \{ \text{signed 16 bit integer} \}
\]

\[
\text{int}_15 = 0 \ldots "7FF; } \{ \text{unsigned 15 bit integer} \}
\]

\[
\text{int}_8u = 0 \ldots "FF; } \{ \text{unsigned 8 bit integer} \}
\]

\[
\text{int}_8 = "80 \ldots "7F; } \{ \text{signed 8 bit integer} \}
\]

\[
\text{int}_7 = 0 \ldots "7F; } \{ \text{unsigned 7 bit integer} \}
\]

This code is used in section 3*.

11*  The term **print** is used instead of **write** when this program writes on **output**, so that all such output could easily be redirected if desired; the term **d_print** is used for conditional output if we are debugging.

\[
\text{define } \text{print}(\#) \equiv \text{write}(\text{term}\_\text{out},\#)
\]

\[
\text{define } \text{print}_\text{ln}(\#) \equiv \text{write}_\text{ln}(\text{term}\_\text{out},\#)
\]

\[
\text{define } \text{new}_\text{line} \equiv \text{write}_\text{ln}(\text{term}\_\text{out}) \quad \{ \text{start new line} \}
\]

\[
\text{define } \text{print}_\text{nl}(\#) \equiv \{ \text{print information starting on a new line} \}
\]

\[
\quad \text{begin } \text{new}_\text{line}; \text{print}(\#);
\]

\[
\quad \text{end}
\]

\[
\text{define } \text{d_print}(\#) \equiv
\]

\[
\quad \text{debug } \text{print}(\#) \text{ gubed}
\]

\[
\text{define } \text{d_print}_\text{ln}(\#) \equiv
\]

\[
\quad \text{debug } \text{print}_\text{ln}(\#) \text{ gubed}
\]
14\* The character set. Like all programs written with the WEB system, DVIcopy can be used with any character set. But it uses ASCII code internally, because the programming for portable input-output is easier when a fixed internal code is used, and because DVI and VF files use ASCII code for file names and certain other strings.

The next few sections of DVIcopy have therefore been copied from the analogous ones in the WEB system routines. They have been considerably simplified, since DVIcopy need not deal with the controversial ASCII codes less than \'40 or greater than \'176. If such codes appear in the DVI file, they will be printed as question marks.

\(\langle\text{Types in the outer block 7}\rangle +\equiv\)
\[\text{ASCII} = 0 \ldots 255;\quad \{\text{a subrange of the integers}\}\]

15\* The original Pascal compiler was designed in the late 60s, when six-bit character sets were common, so it did not make provision for lower case letters. Nowadays, of course, we need to deal with both upper and lower case alphabets in a convenient way, especially in a program like DVIcopy. So we shall assume that the Pascal system being used for DVIcopy has a character set containing at least the standard visible characters of ASCII code ("!" through "~").

Some Pascal compilers use the original name char for the data type associated with the characters in text files, while other Pascals consider char to be a 64-element subrange of a larger data type that has some other name. In order to accommodate this difference, we shall use the name text_char to stand for the data type of the characters in the output file. We shall also assume that text_char consists of the elements \(\text{chr} (\text{first}_{\text{text_char}}) \) through \(\text{chr} (\text{last}_{\text{text_char}})\), inclusive. The following definitions should be adjusted if necessary.

\[\text{define } \text{text_char} \equiv \text{ASCII} \quad \{\text{the data type of characters in text files}\}\]
\[\text{define } \text{first}_{\text{text_char}} = 0 \quad \{\text{ordinal number of the smallest element of text_char}\}\]
\[\text{define } \text{last}_{\text{text_char}} = 255 \quad \{\text{ordinal number of the largest element of text_char}\}\]

\(\langle\text{Types in the outer block 7}\rangle +\equiv\)
\[\text{text_file} = \text{packed file of } \text{text_char};\]
23* If an input (DVI, TFM, VF, or other) file is badly malformed, the whole process must be aborted; DVIcopy will give up, after issuing an error message about what caused the error. These messages will, however, in most cases just indicate which input file caused the error. One of the programs DVItype, TFtoPL, or VFtoVP should then be used to diagnose the error in full detail.

Such errors might be discovered inside of subroutines inside of subroutines, so a procedure called jump_out has been introduced.

```pascal
format noreturn ≡ procedure
  define abort(#) ≡
    begin writeLn(stderr, '␣', '#', '.', '␣'); jump_out;
    end
⟨Error handling procedures 23*⟩ ≡
⟨Basic printing procedures 48⟩
procedure close_files_and_terminate; forward;
  noreturn procedure jump_out;
    begin mark_fatal; close_files_and_terminate; uexit(1);
    end;
See also sections 24*, 25*, 94*, and 109*.
This code is used in section 3*.
```

24* Sometimes the program’s behavior is far different from what it should be, and DVIcopy prints an error message that is really for the DVIcopy maintenance person, not the user. In such cases the program says confusion (indication of where we are).

```pascal
⟨Error handling procedures 23*⟩ +≡
noreturn procedure confusion(p: pkt_pointer);
  begin print('␣!This␣can␣′t␣happen␣[′); print_packet(p); print_Ln('␣).'); jump_out;
  end;
```

25* An overflow stop occurs if DVIcopy’s tables aren’t large enough.

```pascal
noreturn procedure overflow(p: pkt_pointer; n: int_16u);
  begin print('␣!Sorry␣,␣title␣,␣capacity␣exceeded␣[′); print_packet(p);
    print_Ln('␣=␣, n: 1, ′].'); jump_out;
  end;
```
Before a font file can be opened for input we must build a string with its external name.

\[(\text{Globals in the outer block} \ 2^* \ ) + \equiv\]

\[\text{cur\_name}: \uparrow \text{char};\]
\[l\_\text{cur\_name}: \text{int}_{15}; \ \{ \text{this many characters are actually relevant in} \ \text{cur\_name} \} \]

Since files are actually searched through path definitions, the area definitions are ignored here. To reduce the required changes we simply ignore the parameters given to \texttt{make\_font\_name}.

\begin{verbatim}
\textbf{define} append\_to\_name(#) \equiv
\textbf{begin} cur\_name[L\_cur\_name] \leftarrow #; \text{incr}(L\_cur\_name);
\end{verbatim}

\begin{verbatim}
\textbf{define} make\_font\_name\_end(#) \equiv \text{make\_name}
\textbf{define} make\_font\_name(#) \equiv L\_cur\_name \leftarrow 0; \text{make\_font\_name\_end}
\end{verbatim}

The \texttt{make\_name} procedure used to build the external file name. The global variable \texttt{L\_cur\_name} contains the length of a default area which has been copied to \texttt{cur\_name} before \texttt{make\_name} is called.

\begin{verbatim}
\textbf{procedure} make\_name(e : pckt\_pointer);
\textbf{var} b: eight\_bits; \ \{ \text{a byte extracted from} \ \text{byte\_mem} \} \\
\hspace*{1em} n: pckt\_pointer; \ \{ \text{file name packet} \} \\
\hspace*{1em} cur\_loc, cur\_limit: byte\_pointer; \ \{ \text{indices into} \ \text{byte\_mem} \} \\
\hspace*{1em} device ll: int\_15; \ \{ \text{loop index} \} \\
\textbf{ecived}
\textbf{begin} n \leftarrow font\_name(cur\_fnt); cur\_name \leftarrow \text{xmalloc\_array(char, pckt\_length(n) + pckt\_length(e))};
\hspace*{1em} cur\_loc \leftarrow pckt\_start[n]; cur\_limit \leftarrow pckt\_start[n + 1]; pckt\_extract(b); \ \{ \text{length of area part} \} \\
\hspace*{1em} if b > 0 then L\_cur\_name \leftarrow 0;
\hspace*{1em} \textbf{while} cur\_loc < cur\_limit \textbf{do}
\hspace*{2em} begin pckt\_extract(b); append\_to\_name(xchr[b]);
\hspace*{3em} end;
\hspace*{1em} cur\_name[L\_cur\_name] \leftarrow 0;
\textbf{end;}
\end{verbatim}
§ Initialize predefined strings \[ id4(".")("t")("f")("m")(tfm_ext); \] file name extension for TFM files

If no font directory has been specified, we search paths.

(No initialization to be done. Keep this module to preserve numbering.)

If a TFM file is badly malformed, we say bad font; for a TFM file the bad tfm procedure is used to give an error message which refers the user to TToPL and PLtoTF, and terminates DVIcopy.

\[\text{Error handling procedures} \equiv \text{noreturn procedure bad \_tfm;}\]
\[\text{begin print('Bad \_TFM\_file'); print\_font(cur\_fnt); print\_ln('!');}
\[\text{abort('Use TToPL/PLtoTF to diagnose and correct the problem')}\text{); end;}\]
\[\text{noreturn procedure bad \_font;}\]
\[\text{begin new\_line;}\]
\[\text{case font\_type(cur\_fnt) of}
\[\text{defined\_font: confusion(str\_fonts);}\]
\[\text{loaded\_font: bad\_tfm;}\]
\[\langle\text{Cases for bad font 136}\rangle\]
\[\text{othercases abort('internal\_error')}\text{); endcases;}\]
\[\text{end;}\]

To prepare tfm file for input we reset it.

\[\text{TFM\_default\_area\_name\_length and TFM\_default\_area will not be used by make\_font\_name.}\]

\[\text{TFM: Open tfm\_file 95*} \equiv \]
\[\text{make\_font\_name(TFM\_default\_area\_name\_length)(TFM\_default\_area)(tfm\_ext);}\]
\[\text{full\_name \leftarrow kpse\_find\_tfm(cur\_name);}\]
\[\text{if full\_name then}
\[\text{begin resetbin(tfm\_file,full\_name);}\]
\[\text{free(cur\_name);}\]
\[\text{free(full\_name);}\]
\[\text{end}\]
\[\text{else abort('---not\_loaded,\_TFM\_file\_can\_t\_be\_opened!')}\]

This code is used in section 99.

\[\langle\text{Replace z by z' and compute } \alpha, \beta 104*\rangle \equiv \]
\[\text{alpha \leftarrow 16;}\]
\[\text{if } z \geq '1000000000 \text{ then abort('Character size is too large!')}\]
\[\text{while } z \geq '40000000 \text{ do}
\[\text{begin z \leftarrow z \text{ div 2;} alpha \leftarrow alpha + alpha;}\]
\[\text{end;}\]
\[\text{beta \leftarrow 256 \text{ div alpha;} alpha \leftarrow alpha \ast z}\]

This code is used in sections 105 and 152.
§108  Low-level DVI Input Routines. The program uses the binary file variable \texttt{dvi\_file} for its main input file; \texttt{dvi\_loc} is the number of the byte about to be read next from \texttt{dvi\_file}.

\langle Globals in the outer block 2\rangle \equiv
\begin{verbatim}
dvi\_file: byte\_file; { the stuff we are DVIcopying }
dvi\_loc: int\_32; { where we are about to look, in dvi\_file }
full\_name: \uparrow\text{char};
\end{verbatim}

\begin{verbatim}
109*  If the DVI file is badly malformed, we say \texttt{bad\_dvi}; this procedure gives an error message which refers the user to \texttt{DVItype}, and terminates DVIcopy.
\langle Error handling procedures 23\rangle \equiv
noreturn procedure bad\_dvi;
    begin new\_line; print\_ln(\textquote{Bad DVI file: \texttt{loc=} \texttt{dvi\_loc}: 1, \texttt{!}}); 
        print(\textquote{Use DVItype with output level});
        if random\_reading then print(\textquote{=4}) else print(\textquote{<4});
        abort(\textquote{to diagnose the problem});
    end;
\end{verbatim}

\begin{verbatim}
110*  To prepare \texttt{dvi\_file} for input, we reset it.
\langle Open input file(s) 110\rangle \equiv
\begin{verbatim}
dvi\_loc \leftarrow 0;
\end{verbatim}
This code is used in section 241*.
\end{verbatim}

\begin{verbatim}
112*  Next we come to the routines that are used only if \texttt{random\_reading} is true. The driver program below needs two such routines: \texttt{dvi\_length} should compute the total number of bytes in \texttt{dvi\_file}, possibly also causing \texttt{eof(dvi\_file)} to be true; and \texttt{dvi\_move(n)} should position \texttt{dvi\_file} so that the next \texttt{dvi\_byte} will read byte \texttt{n}, starting with \texttt{n = 0} for the first byte in the file.

Such routines are, of course, highly system dependent. They are implemented here in terms of two assumed system routines called \texttt{set\_pos} and \texttt{cur\_pos}. The call \texttt{set\_pos(f, n)} moves to item \texttt{n} in file \texttt{f}, unless \texttt{n} is negative or larger than the total number of items in \texttt{f}; in the latter case, \texttt{set\_pos(f, n)} moves to the end of file \texttt{f}. The call \texttt{cur\_pos(f)} gives the total number of items in \texttt{f}, if \texttt{eof(f)} is true; we use \texttt{cur\_pos} only in such a situation.

function dvi\_length: int\_32;
    begin xfseek(dvi\_file, 0, 2, dvi\_name); dvi\_loc \leftarrow xftell(dvi\_file, dvi\_name); dvi\_length \leftarrow dvi\_loc;
    end;

procedure dvi\_move(n : int\_32);
    begin xfseek(dvi\_file, n, 0, dvi\_name); dvi\_loc \leftarrow n;
    end;
\end{verbatim}
(Initialize predefined strings \(45\)) \(\equiv\)
\[
id\text{3}(\text{."."})(\text{"v"})(\text{"f"})(\text{vf}\text{.ext}); \quad \{\text{file name extension for VF files}\}\]

137* If no font directory has been specified, \texttt{DVIcopy} is supposed to use the default \texttt{VF} directory, which is a system-dependent place where the \texttt{VF} files for standard fonts are kept.

Actually, under UNIX the standard area is defined in an external file \texttt{site.h}. And the users have a path searched for fonts, by setting the \texttt{VFFONTS} environment variable.

138* (No initialization to be done. Keep this module to preserve numbering.)

139* To prepare \texttt{vf\_file} for input we \texttt{reset} it.

Do path searching. But the \texttt{VF} file may not exist.

\[
\langle \text{VF: Open } \texttt{vf\_file} \text{ or } \texttt{goto not\_found} \quad \rangle \equiv
\]

\[
\text{make\_font\_name(VF\_default\_area\_name\_length)(VF\_default\_area)(vf\_ext);} \quad \\
\text{full\_name} \leftarrow \text{kpse\_find\_vf(cur\_name);} \quad \\
\text{if } \text{full\_name} \text{ then} \quad \\
\quad \text{begin} \quad \text{resetbin(vf\_file,full\_name);} \quad \text{free(cur\_name);} \quad \text{free(full\_name);} \quad \\
\text{end}\quad \\
\text{else } \texttt{goto not\_found}; \quad \\
\text{vf\_loc} \leftarrow 0
\]

This code is used in section 151.
§163. \texttt{web2c} does not like array assignments. So we need to do them through a macro replacement.

\begin{verbatim}
define do_vf_move(\#) \equiv vf_move[vf_ptr]\# \leftarrow vf_move[vf_ptr - 1]\#

define vf_move_assign \equiv
\begin{verbatim}
  begin do_vf_move([0][0]); do_vf_move([0][1]); do_vf_move([1][0]); do_vf_move([1][1])
  end
\end{verbatim}
\end{verbatim}

\langle VF: Start a new level 163* \rangle \equiv
\begin{verbatim}
append_one(push); vf_move_assign; vf_push_loc[vf_ptr] \leftarrow byte_ptr; vf_last_end[vf_ptr] \leftarrow byte_ptr;
vf_last[vf_ptr] \leftarrow vf_other
\end{verbatim}

This code is used in sections 162 and 172.

\section*{170. \langle VF: Apply rule 3 or 4 170* \rangle \equiv}
\begin{verbatim}
begin if vf_push_num[vf_ptr] > 0 then
  begin decr(vf_push_num[vf_ptr]); vf_move_assign;
  end
else begin decr(byte_ptr); decr(vf_ptr);
end;
  if cur_class \neq pop_cl then goto reswitch; \{ this is rule 4 \}
end
\end{verbatim}

This code is used in section 168.
The `input_line` routine waits for the user to type a line at his or her terminal; then it puts ASCII-code equivalents for the characters on that line into the `byte_mem` array as a temporary string. Pascal’s standard `input` file is used for terminal input, as `output` is used for terminal output.

Since the terminal is being used for both input and output, some systems need a special routine to make sure that the user can see a prompt message before waiting for input based on that message. (Otherwise the message may just be sitting in a hidden buffer somewhere, and the user will have no idea what the program is waiting for.) We shall invoke a system-dependent subroutine `update_terminal` in order to avoid this problem.

```pascal
define update_terminal ≡ fflush(stdout)  { empty the terminal output buffer }
define scan_blank(#) ≡  { tests for ‘blank’ when scanning (command line) options }
  ((byte_mem[#] = bi("\t")) ∨ (byte_mem[#] = bi(opt_separator)))
define scan_skip ≡  { skip ‘blanks’}
  while scan_blank(scan_ptr) ∧ (scan_ptr < byte_ptr) do incr(scan_ptr)
define scan_init ≡  { initialize scan_ptr }
  byte_mem[byte_ptr] ← bi("\t"); scan_ptr ← pckt_start[pckt_ptr − 1]; scan_skip
```

(See also sections 178, 179, and 189.)

This code is used in section 180.

See also sections 178, 179, and 189.
Now we are ready to put it all together. Here is where \texttt{DVIcopy} starts, and where it ends.

\begin{verbatim}
begin initialize; \{ get all variables initialized \}
\langle\text{Initialize predefined strings 45}\rangle
\langle\text{Open input file(s) 110}\rangle
\langle\text{Open output file(s) 246}\rangle
do_dvi; \{ process the entire DVI file \}
close_files_and_terminate;
end.
\end{verbatim}
To prepare \texttt{out\_file} for output, we \textit{rewrite} it.

\begin{verbatim}
⟨ Open output file(s) \texttt{246} ⟩ ≡
This code is used in section \texttt{241}.
\end{verbatim}

Writing the \texttt{out\_file} should be done as efficient as possible for a particular system; on many systems this means that a large number of bytes will be accumulated in a buffer and is then written from that buffer to \texttt{out\_file}. In order to simplify such system dependent changes we use the \texttt{WEB} macro \texttt{out\_byte} to write the next DVI byte. Here we give a simple minded definition for this macro in terms of standard Pascal.

\begin{verbatim}
define \texttt{out\_byte(#)} ≡ \texttt{put\_byte(#, out\_file)}  \{ write next DVI byte \}
\end{verbatim}
These are the local variables (if any) needed for \texttt{do\_pre}.

\begin{verbatim}
\text{\langle OUT: Declare local variables (if any) for do\_pre \texttt{260}\rangle} \equiv
\text{\texttt{var} }k: \texttt{int}_{15}; \{ \text{general purpose variable} \}
\text{\texttt{var} }p, q, r: \texttt{byte\_pointer}; \{ \text{indices into byte\_mem} \}
\text{\texttt{var} }comment: \texttt{const\_c\_string}; \{ \text{preamble comment prefix} \}
\end{verbatim}

This code is used in section \texttt{204}.

And here is the device dependent code for \texttt{do\_pre}; the DVI preamble comment written to \texttt{out\_file} is similar to the one produced by \texttt{GFtoPK}, but we want to apply our preamble comment prefix only once.

\begin{verbatim}
\text{\langle OUT: Process the pre \texttt{261}\rangle} \equiv
\text{\texttt{out\_one} (pre); out\_one (dvi\_id); out\_four (dvi\_num); out\_four (dvi\_den); out\_four (out\_mag);}
\text{\texttt{p} \leftarrow \texttt{pkt\_start} [\texttt{pkt\_ptr} - 1]; \texttt{q} \leftarrow \texttt{byte\_ptr}; \{ \text{location of old DVI comment} \}
\text{\texttt{comment} \leftarrow \texttt{preamble\_comment}; \texttt{pkt\_room} (\texttt{comm\_length});
\texttt{for} \texttt{k} \leftarrow 0 \texttt{to} \texttt{comm\_length} - 1 \texttt{do append\_byte (xord [uchar\_cast (comment [k])]);
\texttt{while byte\_mem [p] = bi ("\_") do incr (p); \{ \text{remove leading blanks} \}
\texttt{if p = q then Decr (byte\_ptr) (from\_length)
\texttt{else begin k \leftarrow 0;
\texttt{while (k < comm\_length) \wedge (byte\_mem [p + k] = byte\_mem [q + k]) do incr (k);
\texttt{if k = comm\_length then Incr (p) (comm\_length);
\texttt{end;
\texttt{k} \leftarrow \texttt{byte\_ptr} - p; \{ \text{total length} \}
\texttt{if k > 255 then begin k \leftarrow 255; p \leftarrow p + 255 - \text{comm\_length}; \{ \text{at most 255 bytes} \}
\texttt{end;
\texttt{out\_one} (k); out\_packet (new\_packet); flush\_packet;
\texttt{for r} \leftarrow p \texttt{to} q - 1 \texttt{do out\_one} (bo (byte\_mem [r]));
\end{verbatim}

This code is used in section \texttt{204}.
293* System-dependent changes. Parse a Unix-style command line.
This macro tests if its argument is the current option, as represented by the index variable option_index.

```c
#define argument_is(#) \= (strcmp(long_options[option_index].name, #) = 0)
```

(Define parse_arguments 293*)

```c
procedure parse_arguments;
const n_options = 5; \{ Pascal won’t count array lengths for us. \}
var long_options: array [0..n_options] of getopt_struct;
getopt_return_val: integer; option_index: c_int_type; current_option: 0..n_options; k, m: c_int_type;
end_num: ↑char;
begin \{ Define the option table 294* \};
\{ Initialize options 187 \};
repeat getopt_return_val \= getopt_long_only(argc, argv, ””, long_options, address_of (option_index));
if getopt_return_val = -1 then
begin do_nothing; \{ End of arguments; we exit the loop below. \} end
else if getopt_return_val = ”?” then
begin usage(my_name); end
else if argument_is(’help’) then
begin usage_help(DVICOPY_HELP, nil); end
else if argument_is(’version’) then
begin print_version_and_exit(banner, ”Peter Breitenlohner”, nil, nil); end
else if argument_is(’magnification’) then
begin out_mag \= atou(optarg); end
else if argument_is(’max-pages’) then
begin max_pages \= atou(optarg); incr(cur_select); end
else if argument_is(’page-start’) then
begin \{ Determine the desired start_count values from optarg 299* \};
end; \{ Else it was a flag; getopt has already done the assignment. \} until getopt_return_val = -1; \{ Now optind is the index of first non-option on the command line. We can have zero, one, or two remaining arguments. \}
if (optind > argc) \\{ optind + 2 < argc \} then
begin writeLn(stderr, my_name, ”: Need at most two file arguments.”); usage(my_name); end;
if optind = argc then
begin dvi_name \= ”<stdin>”; dvi_file \= make_binary_file(stdin); random_reading \= false; end
else begin dvi_name \= extend_filename(cmdline(optind), ”dvi”); resetbin(dvi_file, dvi_name);
random_reading \= true; end;
if optind + 2 = argc then
begin rewritebin(out_file, extend_filename(cmdline(optind + 1), ”dvi”)); term_out \= stdout; end
else begin out_file \= make_binary_file(stdout); term_out \= stderr; end;
end;
```

This code is used in section 3*.
294*  Here is the first of the options we allow.
(Define the option table 294*) ≡
\[
  \text{current\_option} \leftarrow 0; \ \text{long\_options}[0].\text{name} \leftarrow \text{'help'}; \ \text{long\_options}[0].\text{has\_arg} \leftarrow 0;
  \text{long\_options}[0].\text{flag} \leftarrow 0; \ \text{long\_options}[0].\text{val} \leftarrow 0; \ \text{incr(current\_option)};
\]
See also sections 295*, 296*, 297*, 298*, and 300*.
This code is used in section 293*.

295*  Another of the standard options.
(Define the option table 294*) +≡
\[
  \text{long\_options}[\text{current\_option}].\text{name} \leftarrow \text{'version'}; \ \text{long\_options}[\text{current\_option}].\text{has\_arg} \leftarrow 0;
  \text{long\_options}[\text{current\_option}].\text{flag} \leftarrow 0; \ \text{long\_options}[\text{current\_option}].\text{val} \leftarrow 0; \ \text{incr(current\_option)};
\]

296*  Magnification to apply.
(Define the option table 294*) +≡
\[

(Locate a character packet and goto found if found 87) Used in sections 86 and 88.
(OUT: Declare additional local variables for do_font 283) Used in section 216.
(OUT: Declare additional local variables for do_xxx 270) Used in section 209.
(OUT: Declare additional local variables do_bop 262) Used in section 205.
(OUT: Declare additional local variables do_rule 280) Used in section 213.
(OUT: Declare local variables (if any) for do_char 287) Used in section 214.
(OUT: Declare local variables (if any) for do_down 275) Used in section 211.
(OUT: Declare local variables (if any) for do_eop 264) Used in section 207.
(OUT: Declare local variables (if any) for do_pop 268) Used in section 208.
(OUT: Declare local variables (if any) for do_pre 260*) Used in section 204.
(OUT: Declare local variables (if any) for do_push 266) Used in section 208.
(OUT: Declare local variables (if any) for do_right 272) Used in section 210.
(OUT: Declare local variables (if any) for do_width 278) Used in section 212.
Names of the Sections

29

OUT: Finish incomplete page  289  Used in section 215.
OUT: Finish output file(s)  290  Used in section 215.
OUT: Look for a font file after trying to read the VF file  285  Used in section 216.
OUT: Look for a font file before trying to read the VF file; if found goto done  284  Used in section 216.
OUT: Move down  277  Used in section 211.
OUT: Move right  274  Used in sections 210, 212, 213, and 214.
OUT: Prepare to use font cur_fnt  286  Used in section 217.
OUT: Process a pop  263  Used in section 205.
OUT: Process a down or y or z  276  Used in section 211.
OUT: Process a pop  269  Used in section 208.
OUT: Process a push  267  Used in section 208.
OUT: Process a right or w or x  273  Used in section 210.
OUT: Process an eop  265  Used in section 207.
OUT: Process an xxx  271  Used in section 209.
OUT: Process the pre  261*  Used in section 204.
OUT: Typeset a visible rule  281  Used in sections 213 and 282.
OUT: Typeset a char  288  Used in section 214.
OUT: Typeset a width  279  Used in section 212.
OUT: Typeset an invisible rule  282  Used in section 213.
OUT: Write the postamble  291  Used in section 290.
Open input file(s)  110*  Used in section 241*.
Open output file(s)  246*  Used in section 241*.
Prepare to use font cur_fnt  217  Used in sections 226 and 238.
Print memory usage statistics  242  Used in section 240.
Print more font usage statistics  257  Used in section 242.
Print more memory usage statistics  292  Used in section 242.
Print the job history  243  Used in section 240.
Print valid options  188  Used in section 181.
Replace z by z' and compute α, β  104*  Used in sections 105 and 152.
Set initial values  18, 19, 22, 38, 72, 78, 82, 85, 118, 121, 123, 126, 129, 147, 159, 174, 175, 184, 194, 221, 245, 256  Used in section 3*.
TFM: Convert character-width indices to character-width pointers  106  Used in section 99.
TFM: Open tfm_file  95*  Used in section 99.
TFM: Read and convert the width values  105  Used in section 99.
TFM: Read past the header data  101  Used in section 99.
TFM: Store character-width indices  102  Used in section 99.
VF: Append DVI commands to the character packet  161  Used in section 160.
VF: Apply rule 3 or 4  170*  Used in section 168.
VF: Apply rule 5  172  Used in section 168.
VF: Apply rule 6  171  Used in section 168.
VF: Build a character packet  160  Used in section 151.
VF: Display the recursion traceback and terminate  228  Used in section 227.
VF: Do a char, rule, or xxx  164  Used in section 161.
VF: Do a fnt, a char, or both  165  Used in section 164.
VF: Do a pop  168  Used in section 161.
VF: Do a push  162  Used in section 161.
VF: Do a rule  166  Used in section 164.
VF: Do an xxx  167  Used in section 164.
VF: Enter a new recursion level  227  Used in section 226.
VF: Interpret the DVI commands in the packet  225  Used in section 222.
VF: Locate font cur_parm  149  Used in sections 148 and 150.
\langle VF: Open \texttt{vf\_file} or \texttt{goto not\_found} 139^* \rangle \text{ Used in section 151.}
\langle VF: Prepare for rule 4 169 \rangle \text{ Used in section 168.}
\langle VF: Process the font definitions 153 \rangle \text{ Used in section 151.}
\langle VF: Process the preamble 152 \rangle \text{ Used in section 151.}
\langle VF: Restore values on exit from \texttt{do\_vf\_packet} 224 \rangle \text{ Used in section 222.}
\langle VF: Save values on entry to \texttt{do\_vf\_packet} 223 \rangle \text{ Used in section 222.}
\langle VF: Start a new level 163^* \rangle \text{ Used in sections 162 and 172.}
\langle VF: Typeset a \texttt{char} 226 \rangle \text{ Used in section 225.}
\langle Variables for scaling computation 103 \rangle \text{ Used in sections 99 and 142.}
