This is a list of all substantial corrections made to *Computers & Typesetting* between the first “Millennium edition” of 2000 and the second such edition, which appeared late in 2001. (More precisely, it lists errors to the 16th, 7th, 6th, 4th, and 5th printings of Volumes A, B, C, D, and E, respectively, that were corrected in the 17th, 8th, 7th, 5th, and 6th printings.) Changes to the mini-indexes and master indexes of Volumes B, D, and E are not shown here unless they are not obviously derivable from what has been shown.

Connecticut Yankee come out with only nine or ten bad hyphens:

Page A451, line 23 (01/30/01)

Page A454, lines 23–30 (06/30/01)

If a suitable starting letter is found, let it be in font $f$. Hyphenation is abandoned unless the \hyphenchar of $f$ is a number between 0 and 255, inclusive. If this test is passed, \TeX\ continues to scan forward until coming to something that’s not one of the following three “admissible items”: (1) a character in font $f$ whose \lccode is nonzero; (2) a ligature formed entirely from characters of type (1); (3) an implicit kern. The first inadmissible item terminates this part of the process; the trial word consists of all the letters found in admissible items. Notice that all of these letters are in font $f$.
