Using Lua\LaTeX{} to typesset RTL texte with eledpar

Abstract

This file provides an example on how to use eledpar and Lua\LaTeX{} to typeset a right to left texte with its translation on the facing page.\footnote{The text was provided by Latechneuse on http://tex.stackexchange.com/q/227837/7712}

As you can see, the switch to RTL convention is made \texttt{before} the \texttt{pstart}. It must be also called inside \texttt{\eledsection}. For an example with X\LaTeX{}, look at \texttt{parallel-column-two-languages.tex} file.
